## EVENT PLANNING, IN SYNC.

# One event.
# Many moving parts.

- Bookings, crew, equipment, preparation and budgets must stay aligned.
- Festive-season demand makes resource clashes harder to manage.
- Scattered updates make shortages, task progress and spending harder to see.

# One connected workflow

## Request

**Customers** request events with dates, daily hours and location.

## Review

**Managers** review estimates, approve bookings, and adjust staffing.

## Approve

**The internal team** updates preparation tasks, expenses and receipts.

## Prepare

**Workers** see assigned events in a month calendar.

# AI assists. Managers decide.

**RunPod-trained models** run locally to estimate crew, equipment, cost and selling price.

The **OpenAI assistant** provides planning advice
— not booking changes.

Scheduling rules check availability; **managers control approval.**

**React → Express API → Python ↔ PostgreSQL**

Private receipt files: **Replit App Storage**

# A working prototype, A measurable next step.

Three connected roles:
**Customer, Manager and Worker.**

Numerical models trained on **300** synthetic historical events.

**Next:** compare manual and assisted planning on matched scenarios.

Measure planning time, resource-estimation errors and scheduling conflicts.

Synthetic validation is **not proof of real-company impact.**

# Our Goal is Practical

# Clearer decisions. Coo

# s. Coordinated teams. Bet

ms. Better visibility.

# From booking to delivery

# OpusEvents

Built for Malaysian event-management SMEs.

Designed as an intelligent module for the **Orbyte ecosystem.**

Live Orbyte finance/HR integration is **future work.**
